Executive Summary

Library management is a critical function in educational institutions. A well-organized library ensures that students and faculty members can access learning resources quickly and efficiently.

Traditionally, many libraries maintain registers or basic software applications to track book availability and borrowing activities. These manual processes can lead to delays, data inconsistencies, and difficulty in maintaining accurate records. Digital workflow platforms such as ServiceNow allow organizations to automate routine processes and maintain structured data systems. This project focuses on building a Smart Library Request Workflow using ServiceNow, enabling students to request books online and librarians to approve or manage those requests through an automated workflow.

ServiceNow is a cloud-based enterprise platform widely used for workflow automation and IT Service Management. It provides tools that allow administrators to design applications using configuration rather than heavy programming. Organizations use ServiceNow to automate processes, manage service requests, track incidents, and generate reports. The platform supports role-based access, automation using Flow Designer, and customizable forms and tables. These features make ServiceNow suitable not only for IT operations but also for other operational processes such as library management, equipment tracking, and academic service workflows.

In this project, the Smart Library workflow is implemented using custom tables and automation features available in ServiceNow. Two main tables are created: Book and Borrow Request. The Book table stores information about books including title, author, ISBN number, and availability status. The Borrow Request table records transactions related to book requests, including the user who requested the book, the request date, and the approval status. Automation workflows ensure that when a request is approved, the system automatically updates the book status to 'Issued'. This reduces manual work and prevents errors in book tracking.

The Smart Library system provides multiple benefits for both students and librarians. Students can easily search for books and submit requests without physically visiting the library counter. Librarians gain better control over the inventory and can approve requests through a centralized system.

Automated notifications and reports provide insights into library usage patterns, enabling administrators to make better decisions regarding book purchases and resource allocation.

Chapter 1: Introduction

Library management is a critical function in educational institutions. A well-organized library ensures that students and faculty members can access learning resources quickly and efficiently. Traditionally, many libraries maintain registers or basic software applications to track book availability and borrowing activities. These manual processes can lead to delays, data inconsistencies, and difficulty in maintaining accurate records. Digital workflow platforms such as ServiceNow allow organizations to automate routine processes and maintain structured data systems. This project focuses on building a Smart Library Request Workflow using ServiceNow, enabling students to request books online and librarians to approve or manage those requests through an automated workflow.

Library management is a critical function in educational institutions. A well-organized library ensures that students and faculty members can access learning resources quickly and efficiently. Chapter 2: Project Objectives

The primary objective of this project is to design and implement a Smart Library Management System using ServiceNow. To create a centralized digital platform for managing book requests and approvals. To automate the workflow involved in book borrowing using Flow Designer. To ensure data security through role-based access control. To provide reporting and analytics related to book usage. The primary objective of this project is to design and implement a Smart Library Management System using ServiceNow. To create a centralized digital platform for managing book requests and approvals. To automate the workflow involved in book borrowing using Flow Designer.

To ensure data security through role-based access control. To provide reporting and analytics related to book usage. To automate the workflow involved in book borrowing using Flow Designer. To ensure data security through role-based access control. To provide reporting and analytics related to book usage.

Chapter 3: ServiceNow Platform Overview

ServiceNow is a cloud-based enterprise platform widely used for workflow automation and IT Service Management. It provides tools that allow administrators to design applications using configuration rather than heavy programming. Organizations use ServiceNow to automate processes, manage service requests, track incidents, and generate reports. The platform supports role-based access, automation using Flow Designer, and customizable forms and tables. These features make ServiceNow suitable not only for IT operations but also for other operational processes such as library management, equipment tracking, and academic service workflows.

Chapter 4: System Architecture and Design

The architecture of the Smart Library system is designed around role-based access and data automation. The system consists of users (students and librarians), ServiceNow tables, workflows, and reporting modules. The student interacts with the system by submitting a borrow request. The request is routed to a librarian for approval. Once approved, the system updates the book record automatically. Chapter 5: Database Design

The Book table stores core information related to library books including Title, Author, ISBN, and Status. The Borrow Request table stores transactional data including Requested By, Book Reference, Request Date, and Status. Reference fields establish relationships between tables. Choice fields allow status values such as Requested, Approved, Rejected, and Returned. The Book table stores core information related to library books including Title, Author, ISBN, and Status. Chapter 6: System Implementation

In this project, the Smart Library workflow is implemented using custom tables and automation features available in ServiceNow. Two main tables are created: Book and Borrow Request. The Book table stores information about books including title, author, ISBN number, and availability status. The Borrow Request table records transactions related to book requests, including the user who requested the book, the request date, and the approval status. Automation workflows ensure that when a request is approved, the system automatically updates the book status to 'Issued'. This reduces manual work and prevents errors in book tracking.

Chapter 7: UI Policies

UI Policies in ServiceNow allow administrators to control form behavior dynamically. They can make fields mandatory, visible, or read-only based on certain conditions. This project uses UI Policies to prevent modification of certain fields once a request is approved. UI Policies improve usability and ensure consistent data entry. Chapter 8: Workflow Automation using Flow Designer

Flow Designer is used to automate the approval process. When a Borrow Request record is created, the flow triggers automatically. The system sends an approval request to the librarian role. If the request is approved, the book status changes to Issued. If rejected, the request status is updated accordingly. Flow Designer is used to automate the approval process. Chapter 10: Reporting and Analytics

Reports provide valuable insights into library usage. The 'Most Borrowed Books' report identifies frequently requested books. This information helps librarians manage inventory and purchase new copies when needed. Reports can be displayed using charts such as bar graphs and pie charts. Chapter 11: Testing and Validation

Testing ensures that the system functions correctly. Sample records were created to test request submission and approval processes. The workflow execution logs were examined to confirm correct automation. Access permissions were tested using different user roles. Testing ensures that the system functions correctly. Chapter 12: Project Benefits

The Smart Library system provides multiple benefits for both students and librarians. Students can easily search for books and submit requests without physically visiting the library counter. Librarians gain better control over the inventory and can approve requests through a centralized system. Automated notifications and reports provide insights into library usage patterns, enabling administrators to make better decisions regarding book purchases and resource allocation.

Automated notifications and reports provide insights into library usage patterns, enabling administrators to make better decisions regarding book purchases and resource allocation.

The Smart Library system provides multiple benefits for both students and librarians. Students can easily search for books and submit requests without physically visiting the library counter. Librarians gain better control over the inventory and can approve requests through a centralized system. Automated notifications and reports provide insights into library usage patterns, enabling administrators to make better decisions regarding book purchases and resource allocation.

Chapter 14: Conclusion

The Smart Library workflow successfully demonstrates how ServiceNow can be used to automate non-IT processes. The project improves efficiency, transparency, and reliability in managing library operations. The system can be further expanded to include additional academic services. The Smart Library workflow successfully demonstrates how ServiceNow can be used to automate non-IT processes.
